

# Trying to save money with a temporary fix?

**When you need more than a temporary repair, you need FDR with Cement.**

Using traditional methods to repair deteriorating roads can be very expensive. Most rehab techniques grind away inches of what was a very costly surface material and replace it with a new flexible surface. Without a strong base, it doesn't take the new pavement long to begin rutting, shoving, creating alligator cracks or new potholes all over again.

Full-Depth Reclamation (FDR) with Cement improves the structural characteristics of the road base and even helps increase its load carrying capacity. Best of all, it does all this at a fraction of the cost of a full reconstruction. The FDR with Cement process involves pulverizing the old asphalt pavement so that it is recycled as aggregate and mixed with the underlying soil, cement and water to create a new stabilized base perfect for a thin chip seal, asphalt or concrete top.

Conserve natural resources, save energy and reduce waste by recycling your road. Your wallet will also be glad you chose to rebuild with road strengthening, durable cement.
